

# Isomorphic Graphs

$G$

$H$

$$G \cong H$$

$$H \cong G$$

"Same structure"

isomorphic

Vertices  
and  
edges

$$\phi: V(G) \rightarrow V(H)$$

Each distinct vertex of graph  $G$  should be mapped to each distinct vertex of Graph  $H$ .

Every vertex in graph  $H$ , should get mapped to some vertex in graph  $G$ .

Vertices  
and  
edges

$$\phi: V(G) \rightarrow V(H)$$

"injective"

"surjective"

Surjective  
(not injective)

Every  $B$  has some  $A$

$$\phi: V(G) \rightarrow V(H)$$

"injective"

"surjective"

one-to-one  
correspondence

Function  $\phi$  is called isomorphism.

$\phi: V(G) \rightarrow V(H)$   
 "injective" }  $\rightarrow$  bijective  
 "surjective"  
 $v_1, v_2 \in E(G)$  if and only if  $\phi(v_1) \phi(v_2) \in E(H)$

For any two graphs to be isomorphic, following 4 conditions must be satisfied-

- Number of vertices in both the graphs must be same.
- Number of edges in both the graphs must be same.
- Degree sequence of both the graphs must be same.
- If a cycle of length  $k$  is formed by the vertices  $\{ v_1 , v_2 , \dots , v_k \}$  in one graph, then a cycle of same length  $k$  must be formed by the vertices  $\{ f(v_1) , f(v_2) , \dots , f(v_k) \}$  in the other graph as well.

## Some facts

- Two graphs are isomorphic if and only if their complement graphs are isomorphic.
- Two graphs are isomorphic if their adjacency matrices are same.
- Two graphs are isomorphic if their corresponding sub-graphs obtained by deleting some vertices of one graph and their corresponding images in the other graph are isomorphic.

## Graph Isomorphism Example-

Which of the following graphs are isomorphic?

**G1**

**G2**

**G3**

$G_3$  is neither isomorphic to  $G_1$  nor  $G_2$ .

Graphs  $G_1$  and  $G_2$  are isomorphic graphs.

Which of the following graphs are isomorphic

**G1**

**G2**

**G3**
